DETAILED ACTION

Response to Arguments

1. Applicant's arguments filed 5/16/2007 have been fully considered but are considered moot in view of the new grounds of rejection.

Claim Rejections - 35 USC § 103

2. Claims 58-60, 62-71, and 73-79 are rejected under 35 U.S.C. 103(a) as being unpatentable over RAUSING ET AL (US 3531908) in view of SALEMKA ET AL (4976091) and MUELLER ET AL (US 5787687).

RAUSING ET AL discloses a method and apparatus for filling bags (1) by lowering a filling apparatus (3) to the base of the bag, dispensing bulk liquid (5) into the bag, and simultaneously raising the filling apparatus as the fill level of the bag rises. When the filling apparatus has reached a set point at the mouth of the bag, the fill operation ceases and the bag is closed (8).

RAUSING ET AL does not disclose filling the bag at a first rate and then a second slower rate.

SALEMKA ET AL discloses a method and apparatus for filling containers with a liquid in which the liquid is filled at a first rate and then a slower rate (see SALEMKA ET AL, Abstract).

It would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the invention of RAUSING ET AL by filling the bag at a first rate and then a second slower rate, as taught by SALEMKA ET AL, in order to produce a more precise filling.

The combination of RAUSING ET AL and SALEMKA ET AL does not disclose the weighing process as using first a volumetric measurement and then a weight measurement.

MUELLER ET AL discloses a method and apparatus in which a product filling system (34) dispenses an amount of product into a container. The container is then weighed, the weight being used to determine whether the container is full (see Fig. 4 and column 4:62-5:11).

It would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the combination of RAUSING ET AL and SALEMKA ET AL by adding a weight sensor, as taught by MUELLER ET AL, in order to provide “the prices control which can be exercised” (MUELLER ET AL column 5:6).

Regarding claims 60 and 71, it would have been obvious to one of ordinary skill in the art at the time the invention was made to raise or lower the filling apparatus at whatever speed is best for the dispensing process, since it has been held that discovering an optimum value of a result effective variable involves only routine skill in the art.

Regarding claims 66 and 77, the uptake of the initial nitrogen purge is being read on the claimed aspirating of dust.
